

Uninstalling Sleipnir

Removing the Odin client (Sleipnir) from a platform

The purpose of this document is to describe the process of removing the Sleipnir application from a platform on which it is installed. Specifically, this document highlights the process for a Microsoft Windows platform. In order to proceed you must ensure that you have sufficient rights to your platform to access the control panel and modify settings within it.

Step 1

Open the control panel. This can be done through the Start Menu or Windows Explorer.

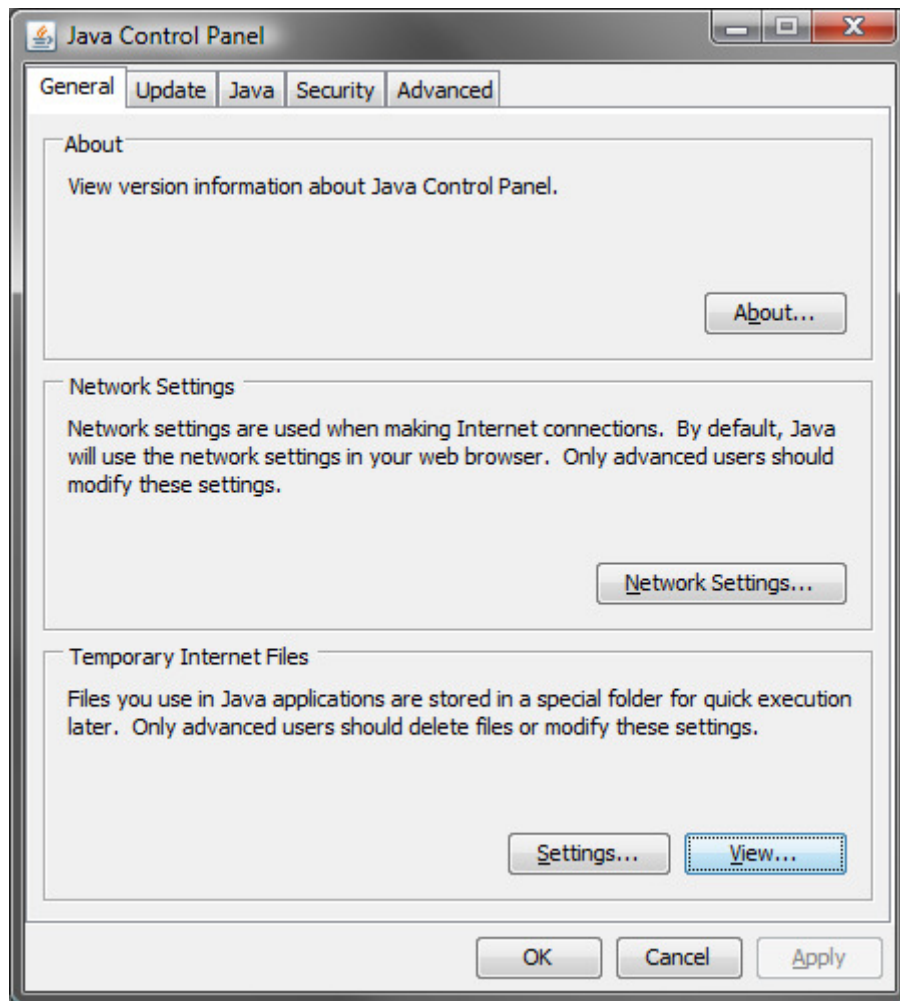

Step 2

Locate the Java control panel. It is named simply "Java" and can only be seen in "Classic View" (see the options on the left-hand side to switch between "Control Panel Home" and "Classic View"). Double-left click to open it.

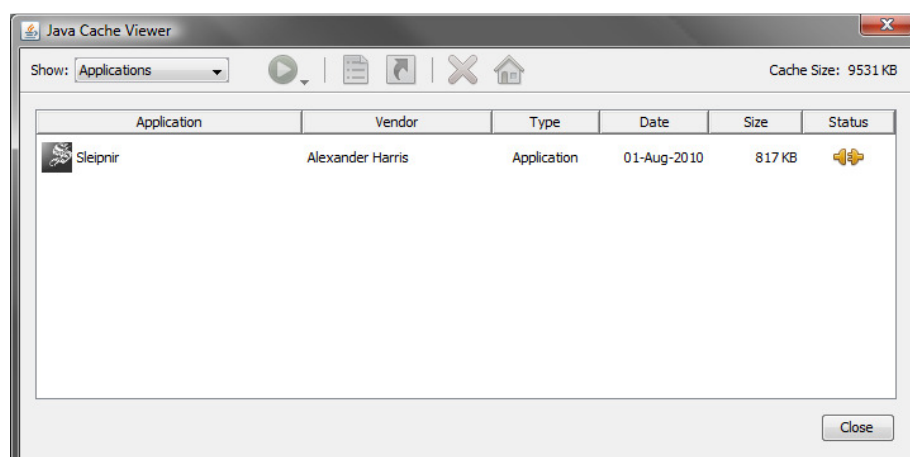

Step 3

Click on "View..." under the "Temporary Internet Files" section at the bottom of the window.

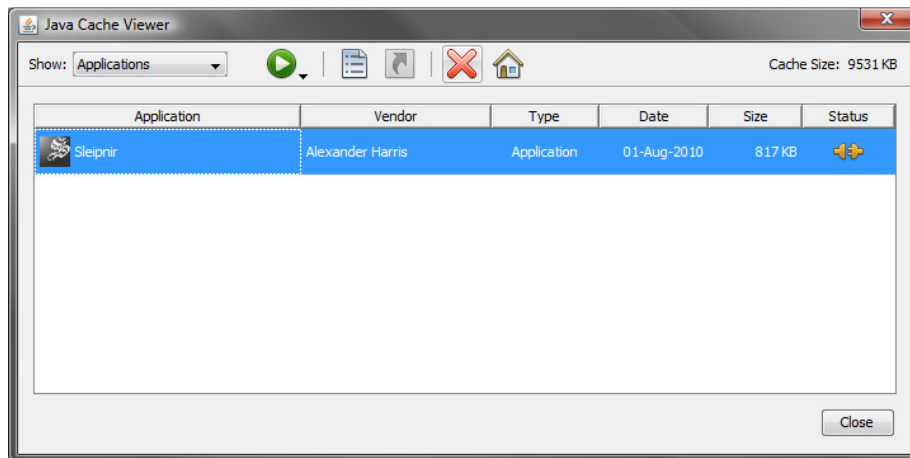

Step 4

In the listing shown will be any applications installed on the machine that have been distributed through Java Web Start. Sleipnir will be listed here (though you may need to scroll through the entries).

Step 5

To remove the application click on its entry in the list and then click on the cross which should now have changed to red. The application will be removed without further confirmation.

If Sleipnir is removed accidentally then it can be quickly reinstalled through the original website.
